Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
 2. Ascertaining the differences between the prior art and the claims at issue.
 3. Resolving the level of ordinary skill in the pertinent art.
 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.
1. Claims 1-10 rejected under 35 U.S.C. 103(a) as being unpatentable over Cotteverte (US Patent No. 6,523,997 B1) in view of Gale (US Patent No. 4,857,250).

Please note the material worked upon in the apparatus is seen as a recitation of intended use and bears no weight to the capability of the apparatus.

Cotteverte 997 teaches an apparatus as shown in Figure 1 with a housing (11) enclosing two extrusion worms (1, 2). The extrusion worms are connected to a

pair of driving shafts (3,4) synced with a pair of receiving shafts (25,26) anticipates as types of stators and having a set of teeth (27,28) and operated by a driving means.

Cotteverte 997 fails to specifically teach the use of a drive motor for operating the extrusion worms.

In a method of extrusion, Gale 250 teaches the use of a stator (Fig 1 Element 20) and rotor (Fig 1 Element 22) affixed to an extruder aiding in its rotation operation as it is driven by an AC motor (Col 10 Lines 41-56).

It would be obvious to one skilled in the art to modify the device shown by Cotteverte 997 with the motor of Gale 250 for automated processing of the device resulting in faster processing time. Furthermore the use of one drive motor would be sufficient for carrying out the necessary job and allowing cost reduction of parts by using one motor rather than multiple motors for operating the device.
